

DECRA Recommends Using Fastener Nut Drivers and Bits That Do Not Exceed 3" In Length

DECRA Roof System hex head threaded fasteners are designed to accommodate most nut drivers and bits in the industry. DECRA recommends that roof installers use a fastener nut driver/bit that does not exceed 3" in length.

Fastener nut drivers and bits exceeding 3" in length create increased angularity stress on the fastener shank which may potentially bend the fastener or offset the axial load during fastener installation and/or removal. The result of this increased stress due to use of a long nut driver/bit can cause the fastener shank to break.
